

Toward a DFT architecture of intentional agents

Gregor Schöner

Doctoral work of Jan Tekülve

Institute for Neural Computation

Ruhr-Universität Bochum, Germany

www.ini.rub.de

Do the concepts of DFT reach all processes of the mind?

- so that DFT would provide a neural foundation for understanding the mind?
- ... hinges on what we mean by the “mind”

Intentionality

- *Intentionality* = the capacity of organisms and their nervous systems to generate mental states that are *about things in the world*
- *things* may include an organism's own body
- *things* may ultimately also includes the nervous system's own states

Two *directions of fit* of intentional states (Searle)

- *world-to-mind*: the world must match the intentional state to fulfill that state's *condition-of-satisfaction* (CoS) => the “motor” flavor of intentionality
- *mind-to-world*: the intentional state must match the state of the world to fulfill the CoS => “perceptual” flavor of intentionality

Six *psychological modes* of intentional states (Searle)

■ *mind-to-world*

■ *perception*

■ *memory*

■ *belief*

■ *world-to-mind*

■ *intention-in-action*

■ *prior intention*

■ *desire*

The six modes reflect the sensory-motor grounding of cognition

■ *mind-to-world*

- *attention, active, perception, working memory*
- *scene memory, event memory*
- *back-ground knowledge, learning from experience,*

■ *world-to-mind*

- *motor control*
- *action plans, decisions, sequences*
- *goals, motivations, emotions*

Six *psychological modes*

- Hypothesis: these psychological mode reach all of the mind

- *mind-to-world*

- *perception*

- *memory*

- *belief*

- *world-to-mind*

- *intention-in-action*

- *prior intention*

- *desire*

A first exploration into intentional systems

An intentional agent in environment

environment

colored objects (small)

paint buckets (tall)

vehicle with arm

perception

see color/feature

sense position, arm, paint
in gripper

intention in action

move in ID

reach to take up paint

reach to apply a coat of
paint

An intentional agent in environment

■ memory

■ of visual scene

■ prior intentions

■ search to paint

■ search to load paint

■ reach to apply paint

■ move to a recalled
location ...

An intentional agent in environment

■ beliefs

■ (propositional)

■ rules linking color
concepts: which paint on
which canvas generates
which new color

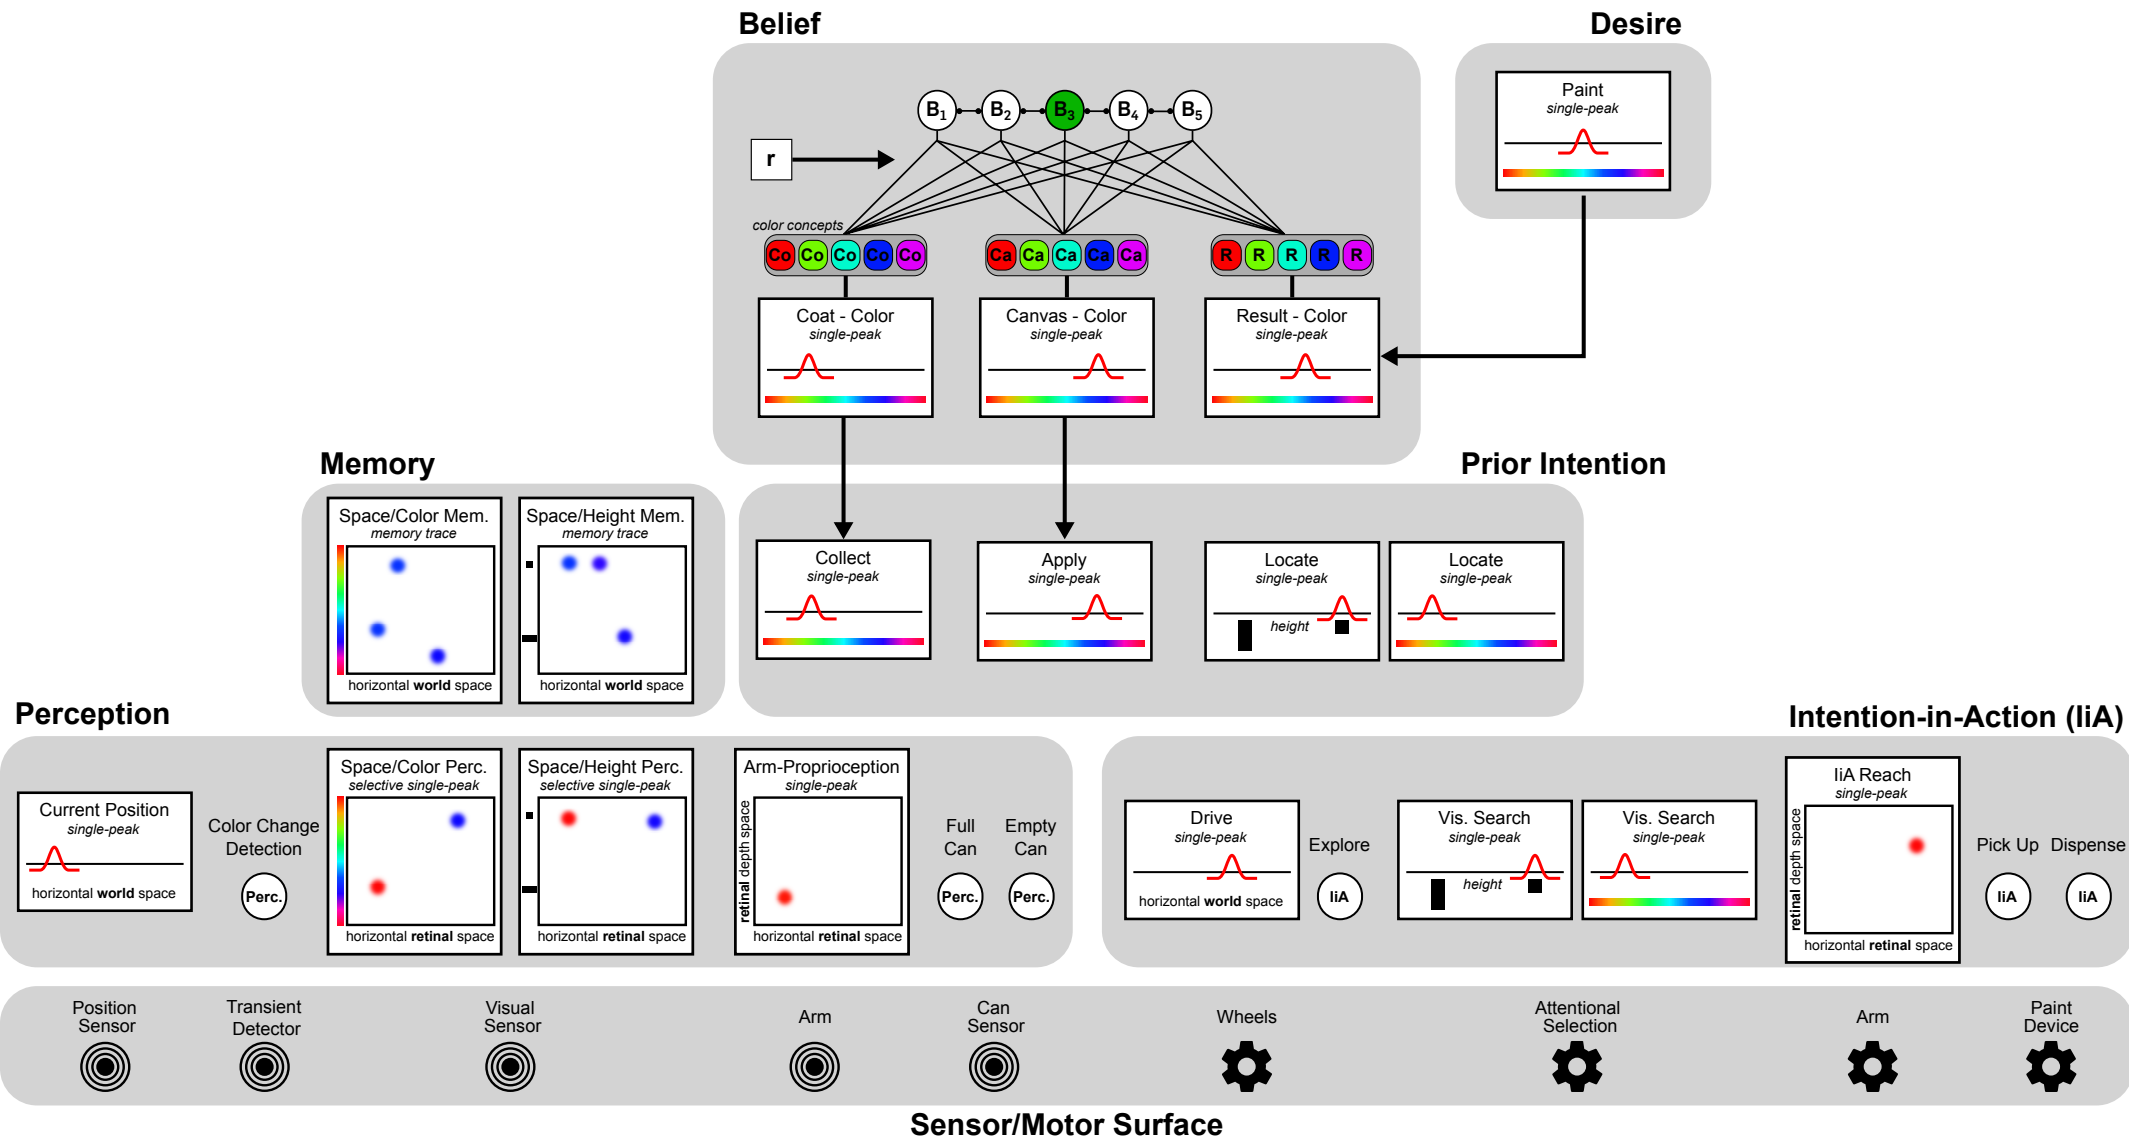

■ learn these beliefs

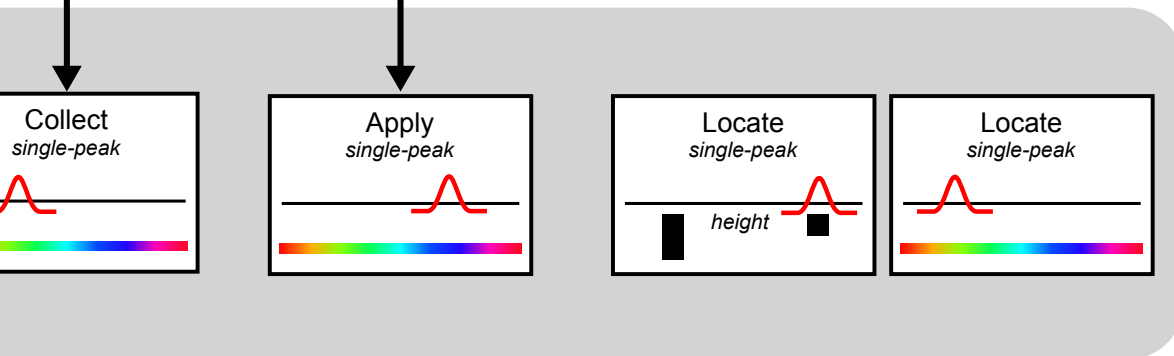

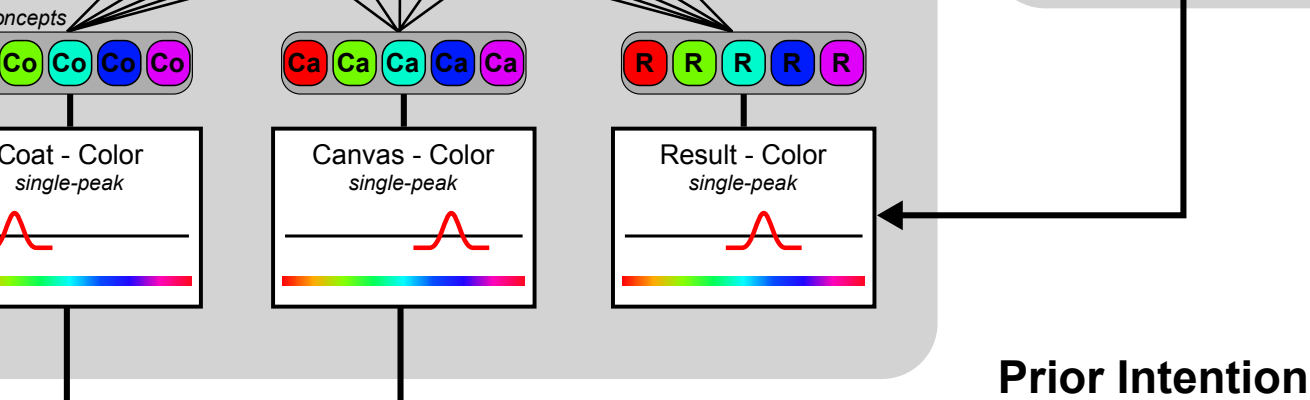

■ desires

■ to point cubes in a
particular color

Neural dynamic architecture

Intention-in-Action (liA)

Intention in action: reach

Memory

Perception

Sensor/Motor S

Perception and memory

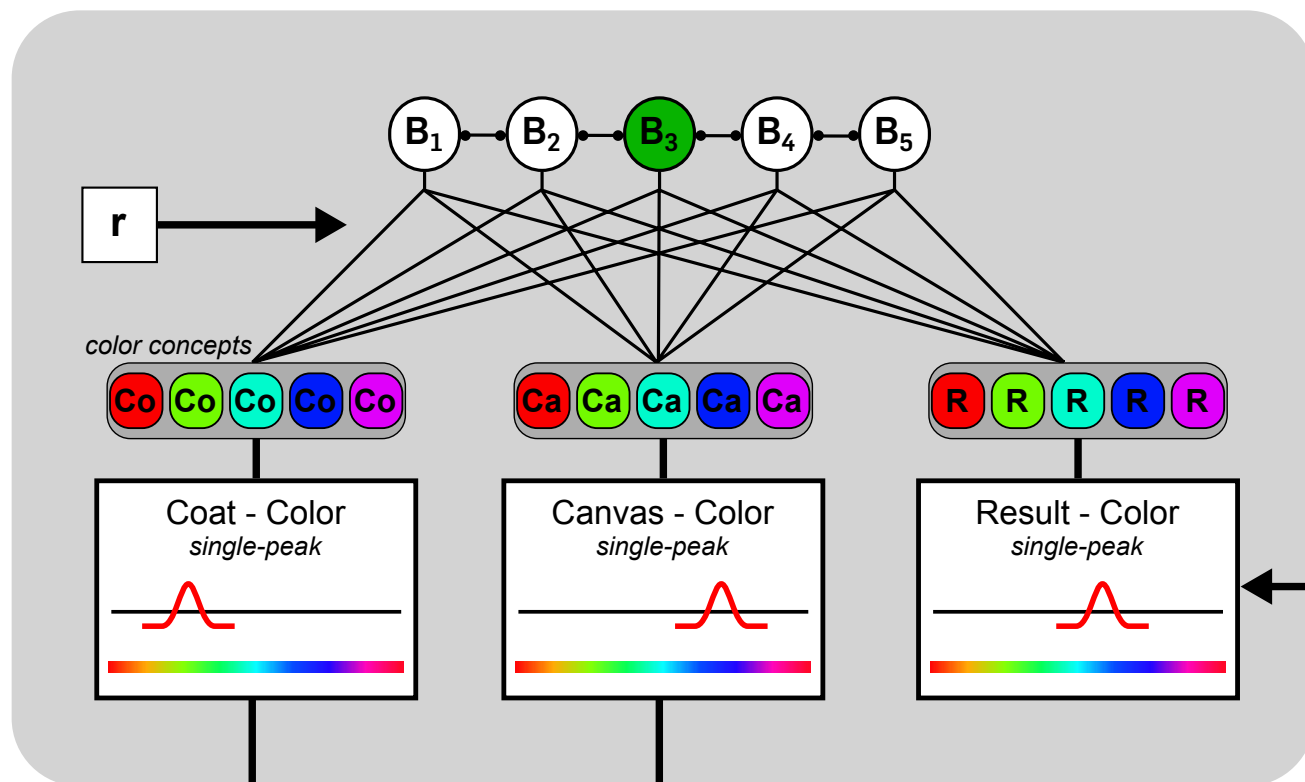

From perception to scene memory

[memory initially empty, then sequentially built]

Belief

Desire

Prior Intention

Space/Height Mem.
memory trace

Space/Height Perc.
selective single-peak

Arm-Proprioception
single-peak

Full Empty

Drive

Vis. Search

Vis. Search

Learning a new belief

Learn a new belief

[while exploring: applying blue paint to yellow cube]

Belief Nodes

Camera

B1 Coat Weights

B1 Canvas Weights

B1 Result Weights

Reward Node

Scene

Coat Color

Canvas Color

Result Color

S/C Change Detector

Recall a belief

[triggered by a desire and objects in scene memory]

Recall-drive-search

[based on a desire and an activated belief,
looking for a tall pink object, which is in memory]

Toward intentional agents

- *Intentional states* as neural attractors
- that emerge and disappear through instabilities controlled by *conditions of satisfaction*
- neural dynamic architecture organizes *processes* of an *intentional agent* across the *two directions of fit* and *six psychological modes*
- neural dynamics scales due to the robustness of attractor states
